BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

  CC surface of endothelial cells that line the interior wall of capillaries. CC surface of endothelial cells that line the interior wall of capillaries. CC VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or CC VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or CC VCAM-4 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows CC white blood cells to adhere to the capillary wall in areas where the CL tissue surrounding the capillary has been infected or damaged. Sometimes CC this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, caussing widespread tissue damage. CC this white blooking this process may be beneficial as therapeutic capents. IA4B1 also recognises, the extracellular matrix glycoprotein fibronectin. Three distinct IA4B1-binding sites have been identified within fibronectin. One site is found in the Hepli region and is cepressed in all isoforms; two others (CS1 and CS5) are present in the CC alternatively spliced type III connecting segments. CS1 has the higher CC affinity for IA4B1 and contains the tripeptide LDV as its minimal active site. Paptides AAR95704-805 are modeled after a portion of the CS1 ceptide that include the LDV domain presented in such a way by its novel CC flanking sequence to produce a potent inhibitor of IA4B1 binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   tissue damage; injury; fibronectin; extracellular matrix glycoprotein; CS1; CS5; H1; LDV; active site.

The peptides are capable of binding to cell adhesion molecules and are used in aqueous irrigation solutions for use during and after endoscopic operations. Preferred irrigation solutions are electrolyte-free and contain 1 microg/ml to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RCD, LDV, LDA, DGEA, GPRP, VTL, YIGSR, KQAGDV and/or REDV (given in one letter amino acid code). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The

                                                                                      The present sequence is a linear stretch of amino acids (present in fibronectin) recognised by the integrin alpha/betal. Integrins are cell surface receptors. The penton base protein (one of the coat proteins) of adenoviruses binds to integrins. The integrins not only provide a binding site for the adenoviral penton base protein, but also mediate cellular adhesion to the extracellular matrix molecules. The specification describes a method of introducing an adenovirus into a cell in vitro having a particular cell surface binding site. The adenovirus is contacted with a bispecific molecule comprising a component that selectively binds a binding domain of the penton base protein of the adenovirus and a second component that selectively binds the cell surface binding site. A complex of the adenovirus and the cell is contacted with it to allow entry of the adenovirus into the cell. The methods can be used for research and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC an existing platelet thrombus in a blood vessel, where the platelet CC thrombus may form an occlusion of a blood vessel, in a subject comprises CC administering a compound which dissociates fibrinogen bound to a first CC site on platelet glycoprotein IIb-IIIa, by binding to a second CC platelet thrombus. The method is used to treat humans with unstable CC platelet thrombus. The method is used to treat humans with unstable CC used to enact de-adhesion of osteoclasts from the bone surface to halt Cc bone loss in a patient with osteoporosti. The methods can be used to enact deadhesion of osteoporosti. The methods can also be used CC pathologic condition associated with angiogenesis, e.g. cancer, diabetic cretinopathy, psoriasis. The methods can also be used to treat tumours, CC atherosclerosis, inflammatory conditions, e.g. arthritis, inflammatory bowel disease, or organ transplant rejection, and asthma. The methods can be used for the dissolution of pre-formed platelet aggregates, which is a CC departure from the current strategy of treatment prior to formation of conscilator (ILD) that can be used in the method of the invention.
                                                                                                                                                                                                                                                            H

                                                                                                                                                          metalloprotease inhibitors. The peptides AAY80466-Y80492 are claimed examples of cell adhesion peptides used in the system of the invention. The system is used to replace, remodel or correct bone defects, e.g. fractures, fissures or bone mass loss. Incorporation of (I) into the scaffold results in rapid seeding by osteoblasts and the development of an organic matrix, i.e. the preformed scaffold replaces the rate-determining step of extracellular matrix formation. The scaffold can be designed to have a predetermined resorption/degradation rate, and may include regulatory compounds for specific cell types.
                                                                                                                                                                                                                                                                                                                       (II) inhibits proteolysis (specifically by plasmin) of extracellular matrix. (I) is preferably selected from: selectin or selectin binding fragments, proteins and peptides that facilitate cell adhesion, plasminogen activator inhibitors, protease inhibitors and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                System for reconstructing osseous tissue, useful e.g. for fractures, comprises scaffold containing promoter of bone inhibitor of bone resorption \,
                                                                                                                                                                                                                                                                                                                                                                                                    bone formation and a component that decreases bone resorption (II). (I) induces migration and adhesion of osteoblasts and osteoclasts and
                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel system for reconstitution of osseous tissue comprising a scaffold carrying a compound (I) that promotes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 14; Page 32;

The peptidomimetics of the clivention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and conditions. Such as asthma, rheumatoid arthritis, osteoarthritis and conditions are consisted in the central nervous system conditions, demyelinating diseases of the central nervous system conditions, demyelinating diseases of the central nervous system conditions, allergies, altherosclerosis, colitis, and conditions, inflammatory bowel disease, kidney inflammation and conditions. Prior art inhibition of VLA-4/CS-1 interaction either continuous response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAY77414-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide tested for their ability to tability to the condition of the CS-1 peptide and therefore less expensive to the condition are smaller in the condition of the CS-1 peptide and therefore less expensive to the condition are smaller in the condition of the CS-1 peptide and therefore less expensive to the condition of the CS-1 peptide and therefore the condition of the CS-1 peptide and the condition of the CS-1 peptide and the condition of the CS-1 peptide an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inducible cell surface protein VCAM-1 (vascular cell adhesion molecule-1) and for the alternatively spliced forms of fibromectin (FN) which contain the CS-1 domain. The novel compounds inhibit cell adhesion, and consequent or associated pathogenic processes mediated by VLA-4, and may therefore be useful in the treatment and prevention of inflammatory, autoimmune, or respiratory disorders. These include asthma, arthritis, psoriasis, multiple sclerosis, transplant rejection, diabetes, and inflammatory bowel disease. Sequences AAY69618-769620 represent peptides derived from the VLA-4-binding domain of the FN CS-1 region which contain the LDV motif and are known to inhibit fibromectin-dependent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           administration of at least one integrin antagonist. The integrin antagonists that may be used in the method include antagonists of alpha-4-subunit containing integrins or antagonists of alpha-1-subunit-containing integrins or antagonists are antibodies specific for VLA-1 (very late antigen-1, alpha-1-beta-1 integrin) or VLA-4 (alpha-4-beta-1 integrin) which inhibit the interaction of the integrin and its cognate ligand (collagen I, collagen IV, and laminin in the case of VLA-1, and fibronectin and VCAM-1 in the case of VLA-4). The method of the invention may be used to treat chronic renal failure, cend-stage renal disease, chronic diabetic nephropathy, diabetic cend-stage renal disease, chronic glomerulonephritis, hereditary chepititis or renal dysplasia. Sequences AB73464-AAB73465 represent comphritis or renal dysplasia. Sequences AB73464-AAB73465 represent comphrities derived from the VLA-4 binding domain (CS-1 region) of the vLA-4 binding domain (CS-1 region) and may consider the vLA-4 binding domain (CS-1 region) and may the method of the invention.

The present invention relates to a peptide with a series of heptad-repeats that mimic a transmembrane domain and a selected cytoplasmic domain attached to the heptad repeats. The invention is useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein with the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying a cytoplasmic domain binding party
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      clustered transmembrane protein having the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying agents as inhibitors of alpha4 integrin biological responses by contacting the structural model with paxillin or a paxillin related molecule in the presence and absence of a test agent and determining binding of paxillin or paxillin related molecule to the structural model. A decrease in binding in the presence of the test agent indicates that the test agent is an inhibitor of alpha4 integrin biological response. Inhibitors of the binding of paxillin to alpha4 are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          heptad repeats. At least a portion of the polypeptide is prepared recombinantly or at least 1 heptad repeat in the series has a different amino acid sequence to other heptad repeats in the series. The polypeptide is useful in the construction of structural models which are useful for evaluating structure and activity of a selected occupied and
                                                                                                                                                                                                                                                                                                     Polypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to the repeats

C -!- FUNCTION: RECOGNIZES AND BINDS THE 7-METHYLGUANOSINE-CONTAINING
C MRNA "CAP" DURING AN EARLY STEP IN THE INITIATION OF ROTEIN
C SYNTHESIS AND FACILITATES RIBOSOME BINDING BY INDUCING THE
UNWINDING OF THE MENAS SECONDARY STRUCTURES (BY SIMILARITY).
C -!- SUBUNIT: EIF4F IS A TRIMER COMPOSED OF EIF4E, EIF4G AND EIF4A
(WHICH CAN CYCLE IN AND OUT OF THE COMPLEX). IN HIGHER PLANTS TWO
C ISOFORMS OF EIF4F HAVE BEEN IDENTIFIED, NAMED EIF4F AND
C EIF(ISO)4F, EIF4F HAS SUBUNITS P220 AND P28, WHEREAS EIF-(ISO)4F
HAS SUBUNITS P82 AND P26 (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NP_BIND

                                                                                    Submitted (AUG-1994) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: PRODUCES ATP FROM ADP IN THE PRESENCE OF A PROTON GRADIENT ACROSS THE MEMBRANE. THE GAMMA CHAIN IS BELIEVED TO BE IMPORTANT IN REGULATING ATPASE ACTIVITY AND THE FLOW OF PROTONS THROUGH THE CF(0) COMPLEX.

-!- SUBUNIT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE SUBUNITS: A.DETA(3), GAMMA(1), DELTA(1), EPSILON(1). CF(1) HAS THREE MAIN SUBUNITS: A, B AND C.

-!- SIMILARITY: BELONGS TO THE ATPASE GAMMA CHAIN FAMILY.

ISAÎZUKA M., IMAÎ H.;

ISAÎZUKA M., IMAÎ H.;

SUBMÎTUKA (AUG-1994) TO THE EMBL/GENBANK/DDBJ GATABASES.

-I- FUNCTION: PRODUCES ATP FROM ADP IN THE PRESENCE OF A PROTON

GRADIENT ACROSS THE MEMBRANE. THE GAMMA CHAIN IS BELIEVED TO BE

IMPORTANT IN REGULATING ATPASE ACTIVITY AND THE FLOW OF PROTONS

THROUGH THE CF(0) COMPLEX.

-I- SUBUNIT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC

CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE

SUBUNITS: ALPHA(3), BETA(3), GAMMA(1), DELTA(1), EPSILON(1). CF(0)

HAS THREE MAIN SUBUNITS: A, B AND C.

CHAIN FROM THE PROTON CHANNEL CHAIN EDULY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ATPG_BAG

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

IA4B1 also recognises the extracellular matrix glycoprotein fibronectin. Three distinct IA4B1-binding sites have been identified within fibronectin. One site is found in the HeplI region and is expressed in all isoforms; two others (CS1 and CS5) are present in the alternatively spliced type III connecting segments. CS1 has the higher affinity for IA4B1 and contains the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CS1 peptide that include the LDV domain presented in such a way by its novel flanking sequence to produce a potent inhibitor of IA4B1 binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vascular cell adhesion molecule-1 (VCAM-1) is protein found on the surface of endothelial cells that line the interior wall of capillaries. VCAM-1 recognises and binds to the integrin alpha-dbeta-1 (IAAB1; or VLA-4 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the tissue surrounding the capillary has been infected or damaged. Sometimes this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. Cpds. capable of blocking this process may be beneficial as therapeutic process.
